

# Orion: A Faster, Safer Website Platform for Small Businesses

A mobile-friendly publishing platform that helps growing businesses update pages faster, protect content, and control website costs.

Many small-business websites become harder to update, more expensive to maintain, and more vulnerable as plugins, databases, and third-party tools accumulate. Orion from SunStar Systems offers a cleaner alternative: a Jamstack wiki platform that publishes fast, secure static webpages while preserving practical content control and version history.

## Why Orion Stands Out

- **Faster customer experience:** Static-first pages load quickly and support stronger first impressions.
- **Stronger security:** Fewer moving parts help reduce common maintenance and security risks.
- **Clear editorial control:** Version-managed workflows make it easier to review, restore, and protect key content.
- **No proprietary lock-in:** Standard Markdown and version-control workflows simplify long-term ownership.

## Best-Fit Use Cases for Small Businesses

Orion is especially useful for South Florida service firms, professional practices, retailers, agencies, consultants, nonprofits, and technology-focused organizations that publish information often. It can support public websites, service pages, product information, documentation, internal playbooks, and client-facing resources.

## Why It Matters Now

Customers expect fast, mobile-friendly websites, and owners need a site they can update without creating technical debt. Orion combines modern Jamstack performance with practical content governance.

## Next Step

If your business is planning a website refresh or replacing an aging CMS, Orion is worth evaluating. Start by identifying the content your team updates most often and the website costs you want to control over the next year.
